

Setting Up A Spring boot Project

start.spring.io → utility website created by spring developers
→ provides boilerplate code, to get you started fast

→ > 90% of the companies still use maven build tool

→ SNAPSHOT → early release versions (in beta phase)

Project Metadata

→ Group → unique (company name)

→ Artifact → It is the single packaged file that gets outputted from the application, which you can run/deploy independently

→ package name → group + artifact

→ Packaging → Once you build your project, you can convert it into one single file → JAR / WAR → mostly legacy

↓
Java Archives
(most modern)

Actual project structure

→ src/main/java

├── com...

├── Application ← Entry point of the entire application

└──

/resources

├── static

├── templates

└── application.properties

} this folder is shipped as it is inside the JAR, where all the java classes are converted

into .class files such that they
can be added to the classpath

→ mvnw → script that maven uses

→ mvnw.cmd → this is present such that we don't have to
explicitly install maven to work on the project

pom.xml (Project Object Model)

→ core of the project

→ maven uses this to build your project

→ <parent>

<groupId> ...

<artifactId> ...

<version> ...

<relativePath/> ..

</parent>

} all the core dependencies that
spring & springboot require are coming
from this dependency
