

Springboot & Spring Framework

HTTP (Hyper Text Transfer Protocol) → It's the language / format / set of rules established governing the interaction b/w the client & the server

- ↳ Request structure?
- ↳ Response structure?
- ↳ method? (GET, PUT, ...)
- ↳ how data will be sent? (encrypted / non-encrypted?)

HTTP

HTTPS

Request

- ↳ method name
- ↳ uri / endpoint?
- ↳ headers? (additional metadata info)
- ↳ body? (payload)

Header:

accept: application/json → declare it's preferred format that it wants to receive from the server

auth: _____

Content-Type: _____ → tells the server what is currently being sent

Response

- ↳ status code (200: OK, 201: Created, 500: Internal Server Error, 404: Resource not found)
- ↳ Headers (Content-Type: application/json)
- ↳ body
[message: "login successful"]

monolithic architecture → the app contains all the endpoints & services

microservice architecture → the app has been broken down into multiple modules / services each pertaining to its own business logic. These services however interact with each other
